Introducing restrictions on who can be matched to whom: calipers

In the nuclear plants example, suppose we choose to insist upon a caliper of three years in the date of construction. This would forbid five potential matches, indicated below in red.

| Exist- <br> ing | H | I | J | K | L | M | N | O | P | Q | R | S | T | U | V | W | X | Y | Z |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |

| E | 17 | 20 | 16 | 32 | 18 | 26 | 20 | 18 | 12 | 24 | 0 | 2 | 20 | 6 | 8 | 4 | 14 | 20 | 14 |
| F | 20 | Inf | 28 | Inf | 20 | 29 | 22 | 20 | 14 | 26 | 12 | 9 | 22 | 5 | 15 | 12 | 9 | 11 | 12 |
| G | 14 | 32 | 29 | 30 | 18 | 24 | 17 | 16 | 10 | 22 | 12 | 10 | 17 | 6 | 16 | 14 | 4 | 8 | 17 |

Example \# 2: Gender equity study for research scientists ${ }^{1}$

Women and men scientists are to be matched on grant funding.

| Women |  | Men |  |
| :---: | :--- | :---: | :--- |
| Subject | $\log _{10}$ (Grant) | Subject | $\log _{10}$ (Grant) |
| A | 5.7 | V | 5.5 |
| B | 4.0 | W | 5.3 |
| C | 3.4 | X | 4.9 |
| D | 3.1 | Y | 4.9 |
|  |  | Z | 3.9 |

[^0]
## Full Matching ${ }^{2}$ the Gender Equity Sample

| Women |  | Men |  |
| :---: | :--- | :--- | :--- |
| Subject | $\log _{10}($ Grant $)$ | Subject | $\log _{10}$ (Grant) |
| A | 5.7 | V | 5.5 |
| B | 4.0 | W | 5.3 |
| C | 3.4 | X | 4.9 |
| D | 3.1 | Y | 4.9 |
|  |  | Z | 3.9 |

- Similar to matching with replacement, but creates disjoint matched sets — better for tests \& CIs.
- In contrast to pair matching, it finds matches for everyone with a suitable counterpart.
- In contrast to multiple controls matching, it doesn't force poor matches
${ }^{2}$ (Rosenbaum, 1991; Hansen and Klopfer, 2005)
Full Matching ${ }^{2}$ the Gender Equity Sample

| Women |  | Men |  |
| :---: | :--- | :--- | :--- |
| Subject | $\log _{10}($ Grant $)$ | Subject | $\log _{10}$ (Grant) |
| A | 5.7 | V | 5.5 |
| B | 4.0 | V | 5.3 |
| C | 3.4 | Y | 4.9 |
| D | 3.1 |  | 4.9 |
|  |  |  | 3.9 |

- Similar to matching with replacement, but creates disjoint matched sets - better for tests \& Cls.
- In contrast to pair matching, it finds matches for everyone with a suitable counterpart.
- In contrast to multiple controls matching, it doesn't force poor matches.

[^1]
## Full Matching² the Gender Equity Sample

| Women |  | Men |  |
| :---: | :--- | :--- | :--- |
| Subject | $\log _{10}($ Grant $)$ | Subject | $\log _{10}$ (Grant) |
| A | 5.7 | W | 5.5 |
| B | 4.0 | 5.3 |  |
| C | 3.4 | Y | 4.9 |
| D | 3.1 |  | 4.9 |
|  |  |  | 3.9 |

- Similar to matching with replacement, but creates disjoint matched sets - better for tests \& Cls.
- In contrast to pair matching, it finds matches for everyone with a suitable counterpart.
- In contrast to multiple controls matching, it doesn't force poor matches

[^2]Full Matching ${ }^{2}$ the Gender Equity Sample

| Women |  | Men |  |
| :---: | :--- | :--- | :--- |
| Subject | $\log _{10}($ Grant $)$ | Subject | $\log _{10}$ (Grant) |
| A | 5.7 | W | 5.5 |
| B | 4.0 |  | W |
| C | 3.4 | 4.9 |  |
| D | 3.1 |  | Y |

- Similar to matching with replacement, but creates disjoint matched sets - better for tests \& Cls.
- In contrast to pair matching, it finds matches for everyone with a suitable counterpart.
- In contrast to multiple controls matching, it doesn't force poor matches.
- In optmatch, can be combined with structural restrictions.

[^3]
## Outline

Optimal matching of two groups
Comparing nuclear plants: an illustration

Generalizations of pair matching

The R implementation

## Arguments to fullmatch()

distance The argument demanding most attention from the user, b/c it defines "good" matches and because very large distance matrices can tax R's memory limits. both of these efforts.
min.controls, max.controls In propensity matching, can be important for efficiency - see Hansen (2004), Augursky and Kluve (2004)
omit.fraction for use in matched sampling (as opposed to matching all or most of a sample). Not needed for getting rid of subjects without suitable potential matches. If you're not specifically out to reduce the size of the control group, can be ignored.

## Under the hood

Full matching via network flows ${ }^{3}$

[^4]
## Arguments to fullmatch ()

distance The argument demanding most attention from the user, b/c it defines "good" matches and because very large distance matrices can tax R's memory limits. A new helper function, makedist (), eases both of these efforts.
min.controls, max.controls In propensity matching, can be important for efficiency — see Hansen (2004),
Augursky and Kluve (2004).
omit.fraction for use in matched sampling (as opposed to matching all or most of a sample). Not needed for getting rid of subjects without suitable potential matches. If you're not specifically out to reduce the size of the control group, can be ignored.

## Summary

- With optmatch, R offers the most comprehensive optimal matching implementation for statistics.
- fullmatch () solves optimally such traditional problems as matched sampling, pair matching, and matching with $k$ controls.
- fullmatch () can also solve matching problems flexibly, and far more effectively, by way of full matching, with or without structural restrictions (Hansen and Klopfer, 2005; Hansen, 2004).
- The effort required to code optimal and full matching algorithms seems to have dissuaded their widespread use Now that l've made that effort, perhaps this situation can change! :)

## Summary

- With optmatch, R offers the most comprehensive optimal matching implementation for statistics.

Example with propensity scores and stratification prior to matching

```
```

>nuclear\$pscore <- glm(pr~.-cost,

```
```

>nuclear\$pscore <- glm(pr~.-cost,

+ family=binomial(),data=nuclear)\$linear.predictors
+ family=binomial(),data=nuclear)\$linear.predictors
> pscorediffs <- function(trtvar,data) {
> pscorediffs <- function(trtvar,data) {
+ pscr <- data[names(trtvar), 'pscore']
+ pscr <- data[names(trtvar), 'pscore']
+ abs(outer(pscr[trtvar],pscr[!trtvar], '-'))
+ abs(outer(pscr[trtvar],pscr[!trtvar], '-'))
+ }
+ }
> psd2 <- makedist(pr~pt, nuclear, pscorediffs)
> psd2 <- makedist(pr~pt, nuclear, pscorediffs)
fullmatch(psd2)
fullmatch(psd2)
> fullmatch(psd2, min.controls=1, max.controls=3)

```
```

> fullmatch(psd2, min.controls=1, max.controls=3)

```
```

Jake Bowers' and my RItools package provides
diagnostics.

Example with propensity scores and stratification prior to matching

```
>nuclear$pscore <- glm(pr~.-cost,
+ family=binomial(), data=nuclear)$linear.predictors
> pscorediffs <- function(trtvar,data) {
+ pscr <- data[names(trtvar), 'pscore']
+ abs(outer(pscr[trtvar],pscr[!trtvar], '-'))
+ }
psd2 <- makedist(pr~pt, nuclear, pscorediffs)
fullmatch(psd2)
> fullmatch(psd2, min.controls=1, max.controls=3)
fullmatch(psd2, min=1, max=c('0'=3, '1'=2))
```

effects to treatment ..."
\end{tabular} & Rosenbaum (2002b), "Covariance adjustment ...." \\
\hline Conditional \({ }^{\text {a }}\) & Agresti (2002); Cox and Snell (1989), Analysis of binary data & ordinary \(\mathrm{OLS}^{b}\) is fine; see also Rubin (1979), "Using multivariate matched. . .." \\
\hline Bayes, esp. hierarchical linear models & Agresti (2002) & Smith (1997), "Matching with multiple controls..."; Raudenbush and Bryk (2002), Hierarchical linear models \\
\hline
\end{tabular}

\footnotetext{
\({ }^{\text {a }}\) Uses a fixed effect for each matched set.
\({ }^{b_{i . e .}}\)., OLS with a fixed effect for each matched set plus treatment effect(s)
\({ }^{c}\) Uses a random effect for each matched set.
}```

[^0]:    ${ }^{1}$ Discussed in Hansen and Klopfer (2005), Hansen (2004)

[^1]:    ${ }^{2}$ (Rosenbaum, 1991; Hansen and Klopfer, 2005)

[^2]:    ${ }^{2}$ (Rosenbaum, 1991; Hansen and Klopfer, 2005)

[^3]:    ${ }^{2}$ (Rosenbaum, 1991; Hansen and Klopfer, 2005)

[^4]:    ${ }^{3}$ (Hansen and Klopfer, 2005, Fig. 2). Time complexity of the algorithm is $O\left(n^{3} \log (n \max (\right.$ dist $\left.))\right)$.
