

Adaptive Nonparametric Statistics with Applications to Gene Expression Data

John Kloke, Joseph McKean, Patrick Kimes, Hilary Parker

Keywords: gene expressions, genetics

Rank-based methods offer the analyst a robust alternative to traditional likelihood or least squares methods. In this talk we briefly review adaptive nonparametric methods for the two sample location problem. Next we discuss an adaptive estimation scheme for estimating a shift parameter. In the remainder of the talk we illustrate these methods via an R package we are developing and apply them to gene expression data.
