MOTIVATION

- Different interpretations in applying statistical methods and terminology is easily found among scientists and professionals in statistics
- Achieving unique and worldwide agreed criteria is the goal of the ISO standards
- An ISO standard is a worldwide agreed and accepted document developed by experts from countries all over the world
- Research projects **funding schemes** are more and more **requiring** the adoption and creation of standards

ISO & AENOR

International
Standardization
Organization

- Some ISO standards are very well known such as ISO 9001 or ISO 14001 but ISO standards cover many and varied fields and Statistics is one of them
- Standards on Statistics are developed by a specific Technical Committee (TC):

ISO/TC 69 - Applications of statistical methods

"Standardization in the application of statistical methods, including generation, collection (planning and design), analysis, presentation and interpretation of data."

Spanish Standardization Body

- Member of ISO and of ISO/TC 69
- Responsible for the adoption and management of ISO Standards on statistics in Spain
- A specific technical body for statistics standardization within its structure:

CTN66/SC3: Métodos estadísticos (Statistical methods)

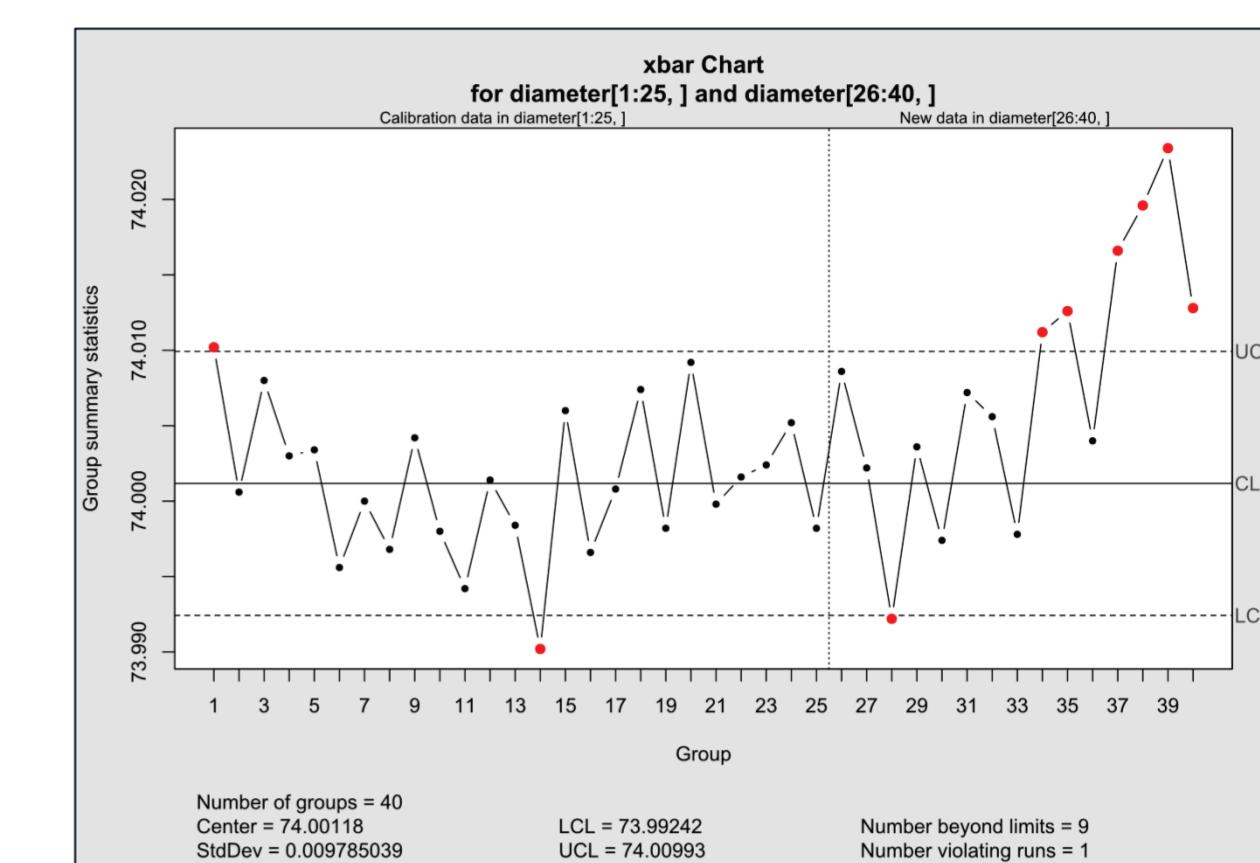

- Promotion of the use of standards on Statistics by professionals, academics and scientists
- Participate in the development of international standards on Statistics
- Sampling procedures and schemes for inspection, Six Sigma, vocabulary, etc

CONCLUSIONS AND FURTHER WORK

- Data Scientists, and practitioners in general, can take advantage of the synergies between the knowledge and use of international standards and the use of R
- R programs can be easily verified (which is a requirement in many standards, e.g., ISO 9001) as it is Open Source
- Thus, any company or organization can go beyond the traditional « Quality Certified » stamp and extend the use of international standards to their analyses
- New book in preparation for the Springer useR! Series focusing on ISO standards
